

RMF Assessment: The State Institute of Science and Technology

Categorize Task #1:

1. Determine whether the controls for Confidentiality, Integrity, and Availability should be applied at the Low, Moderate, or High level. Please justify your CIA rating for each information type and make sure to note your constraints and assumptions as well. Use your determinations to fill out the table below:

	Criteria			Justification	Assumptions/Constraints
	Confidentiality	Integrity	Availability		
SIST AWS Applications					
HR Application					
HR Strategy	Moderate	Moderate	low	Internal workforce planning exposure impacts operations but not mission failure	Internal planning data only
Benefits Management	Moderate	High	Moderate	Contains employee financial and benefits data	Employees' financial records
Employee Performance Management (w/ PII)	High	High	Moderate	Contains PII of employees	Sensitive employee PII data stored
GMAT Application					
System and Network Monitoring	Moderate	High	High	Exposure can reveal security posture and integrity and availability are critical for threat detection	Continuous monitoring is required
System Development	Moderate	High	Moderate	Source code exposure increases risk so integrity is very important to prevent vulnerability	Secure development lifecycle
Vulnerability data (Not in NIST SP800-60, perform	High	High	High	Exposure provides attack paths so integrity and availability is required for redemption	Sensitive vulnerability details stored

<i>your own research & analysis)</i>					
FCIN Application					
Funds Control	High	High	High	Financial control data exposure open doors to frauds so accuracy and availability is important	Government financial operations
Payments	High	High	High	Transaction data is sensitive	Includes payment processing data
SIST Data Center Applications					
FORD Application					
Training & Employment	Moderate	Moderate	Low	Employment training records sensitive but is not mission critical so downtime is triable	No classified workforce data
CHEVY Application					
Manufacturing	Moderate	High	High	Incorrect data can impact manufacturing, safety and production	Production supports mission operations
Construction	Moderate	High	Moderate	Incorrect construction data risks structural issues	Infrastructure design data stored

2. Determine a high-water mark for each Application and then determine the Security Categorization for the SIST Web Infrastructure System. Please justify your high-water mark for each Application.

Application	High Water Mark	Justification
HR Application	High	Contains high confidentiality and integrity (PII)
GMAT Application	High	Monitoring and vulnerability data require high integrity and availability
FCIN Application	High	Financial and payment data requires high CIA protection
Ford Application	Moderate	No high impacts
Chevy Application	High	Manufacturing integrity and availability are high due to safety risks
SIST Web Infrastructure	High – Multiple system with high impact levels	

System Security Categorization
